Anmol Jain

FULL-STACK ENGINEER · REACT · NODE.JS · TYPESCRIPT · DISTRIBUTED SYSTEMS

Chandigarh, India · anmoljain987@gmail.com · +91 94162 27985 · linkedin.com/in/anmoljain987 · github.com/anmoljain987

Full-stack engineer and team lead who ships features end to end — data model, ClickHouse query layer, GraphQL API, React surface, and the deployment that takes it live. Four years at one company, promoted twice in my first 22 months. I own roughly 40 of our 95 services and have shipped in 89 of the 104 repositories behind two advertising SaaS products, and contribute ~760 commits a year to the React/Next.js application alongside a dedicated frontend team. The range is the point: I take a feature from "what should this screen say" to a ClickHouse query plan without a handoff.

EXPERIENCE

Software Engineer II, Team Lead — Idea Clan

Jun 2022 – Present

Junior Software Developer Jun 2022 → **Full Stack Developer** Sep 2022 → **SDE II & Team Lead** Apr 2024 — **two promotions in 22 months**

FabFunnel (marketing automation and campaign management SaaS) and Lookfinity (multi-tenant ad platform) — ~95 microservices, Node.js/TypeScript on Kubernetes, ClickHouse analytics, Apollo Federation.

- **Ship features end to end** — schema and migrations, ClickHouse query layer, GraphQL API, React/Next.js surface, and the release that puts it in production. Recent: per-user spend attribution, the AND/OR filter builder, bulk campaign management.

\n \2 microservices forming the shared platform layer behind both products: the third-party integration services, the reporting engine, and the automation engine.

- **Own the layer that reconciles 15 third-party data sources into one analytics schema** — 12 ad platforms (Meta, Google, TikTok, Snapchat, NewsBreak, OpenAI Ads, BIGO and others) plus the Voluum, Redtrack and Clickflare trackers, each with different auth, rate limits, pagination and metric definitions, so one query compares spend and revenue across all of them.
- **Own the automation engine that runs the platform's scheduled work** — rule evaluations on a strict 15-minute cycle, ~1,700 runs a day scanning ~5.8 billion rows, executing budget and status changes against live advertiser accounts where a wrong write moves real money.
- **Originated the company's integration architecture across two generations of the platform.** I started 10 of its integration services, including the archetype every later one is cloned from, and led the engineers who built the rest. Product asked for three platforms last year; we shipped seven, via a playbook that halved from-scratch build time.
- **Built and operate the Kafka → Vector → ClickHouse analytics platform** — four production clusters, **~600 billion rows scanned per month** over 2 million queries, held at 113–216 ms p95, plus the field-catalog and query-builder engine behind every report and automation rule.
- **Lead a team of three engineers** while remaining hands-on across architecture, infrastructure and debugging. Own release readiness for the backend estate — most recent cycle promoted 8 services to production, including two large accumulated releases with order-dependent database migrations, under a documented pre- and post-deployment verification process I introduced.
- **Ran a security and reliability audit across all 44 services**, producing 770 evidence-backed findings and re-verifying closure rather than assuming it. Remediated platform-wide defects in multi-tenant authentication, SQL parameterisation and dependency resolution.
- **Introduced automated testing to services that previously had none** — a GraphQL contract and resolver harness that runs each service's real composed schema with only the I/O boundary mocked; 700+ cases across the three highest-risk services, and a sharp fall in production rollbacks in the period after.
- **~760 commits a year to the React/Next.js application** alongside a dedicated frontend team, while owning the backend it talks to — reporting and dashboard surfaces, the filter builder, the GraphQL codegen pipeline, and shared component and accessibility conventions the FE team adopted, plus a pattern that lets frontend ship in the same pass as the backend rather than waiting on a deployed schema.

- **Set the architecture for a new Temporal-based workflow engine**: reviewed the initial build and found cross-tenant data exposure and a publicly-readable asset bucket; chose the execution engine on a costed managed-vs-self-hosted analysis; scoped 15 tasks across 5 engineers and designed its per-run pricing model.
- **Set engineering standards beyond my own team.** Authored the frontend branching and merge policy the organisation adopted, brokered the QA-to-engineering working agreement that ended a multi-day dispute, and built the internal layer behind both: 122 implementation guides across 42 repositories plus a cross-service decision ledger.

  Infrastructure: Kubernetes via Helm and GitOps/ArgoCD, Jenkins, Kafka topic provisioning on Confluent Cloud, ClickHouse Cloud ops, Grafana/Loki. Cut ~$3,000/month in infra spend; reduced a core API path from ~800 ms to ~400 ms.

TECHNICAL SKILLS

Languages	TypeScript, JavaScript (Node.js), Python, SQL
Frontend	React, Next.js, Redux Toolkit, Apollo Client, TypeScript, GraphQL codegen, Ant Design
Backend	Node.js, Express, GraphQL & Apollo Federation, REST, TypeORM, microservices
Data	ClickHouse, PostgreSQL, MySQL, MongoDB, Redis, Kafka, RabbitMQ, Vector
Infrastructure	Kubernetes, Helm, ArgoCD / GitOps, Docker, AWS (EKS, ECR, S3), Jenkins, CI/CD
Observability	Grafana, Loki, Prometheus, OpenTelemetry

RECOGNITION

Above & Beyond Innovations Award
Idea Clan · April 2026
Fourth recognition in four years — one per year of tenure.

EDUCATION

Full-Stack Web Development
Masai School, Bengaluru · 2021–2022

B.Sc. Physical Education & Sports Science
Guru Nanak Khalsa College · 2018–2021
First Class with Distinction

BEFORE SOFTWARE

National-level table tennis player and coach. Coached 50+ students over five years, producing 15 state and 7 national players; captained Chandigarh region at school nationals.
